M4 Defect Log

Project: Personal Portfolio Website
Testing Viewports: 320px, 768px, and 1440px

Report 1: Navigation at 320px

AI-Reported Symptom: Navigation links may crowd together, overlap, or become difficult to read on a narrow mobile screen.

Test Result: Not Reproduced

Actual Observation: All four navigation links were visible and readable, with appropriate spacing. No overlap or cutoff was observed.

Report 2: Hero Heading at 320px

AI-Reported Symptom: The hero heading may wrap awkwardly or make the introductory text look cramped on a narrow screen.

Test Result: Not Reproduced

Actual Observation: The heading wrapped cleanly and remained readable. The hero section did not appear cramped.

Report 3: Profile Image at 320px

AI-Reported Symptom: The profile image may appear too large, too small, or poorly proportioned on a narrow mobile screen.

Test Result: Not Reproduced for Image Sizing

Actual Observation: The profile image size looked acceptable. However, the Contact navigation link appeared slightly too far to the right. This was a separate minor alignment observation.

Report 4: Navigation at 768px

AI-Reported Symptom: Navigation links may have inconsistent spacing or alignment at tablet width.

Test Result: Not Reproduced

Actual Observation: The navigation appeared clean and readable, with no obvious spacing or alignment problems.

Report 5: Hero Layout at 768px

AI-Reported Symptom: The hero text and profile image may look unbalanced or poorly arranged at tablet width.

Test Result: Not Reproduced

Actual Observation: The hero text and profile image looked balanced. The content was readable, and the layout appeared clean.

Report 6: Feature Cards at 1440px

AI-Reported Symptom: The feature cards may appear too far apart, with text that is too small to read comfortably on a wide screen.

Test Result: Reproduced Before Revision

Actual Observation: The feature-card text appeared too small, and the cards felt too far apart.

Revision Made: The stylesheet was revised to improve typography, card spacing, and the overall layout.

Retest Result: After the CSS revision, the layouts at 320px, 768px, and 1440px looked good.

Final Status: The reported visual issue was addressed and the updated layouts were checked at all three viewport widths.
