AI Interaction Log

Project: IT0043L Module 4, Technical Assessment 3: AI Responsive Layout Evaluation
Date: October 30, 2026
AI Tool Used: ChatGPT
Model: GPT-6
Purpose: To evaluate the responsiveness of my personal portfolio website, identify possible visual defects, verify reported issues at different viewport widths, and improve the website's CSS.

Purpose of AI Assistance

ChatGPT was used to generate potential visual defect reports for my personal portfolio website at viewport widths of 320px, 768px, and 1440px. I tested the reported symptoms using my website in the browser and recorded whether each issue was reproduced. I also used ChatGPT to help revise the CSS after identifying readability and spacing issues in the feature cards at 1440px. The reported issues and suggested improvements were checked against my actual observations.

Interaction Records

The following sections contain the prompts and responses exchanged with ChatGPT during the evaluation process. They are arranged in chronological order and include the testing observations, AI suggestions, revisions, and retesting results.

Lucman, Zaheerah Azrah G.
DF21

Act as a QA tester. I will describe my layout and paste my CSS. Report defects as symptoms at specific viewport widths. Never name the property at fault and never give code.
My website is a personal portfolio with a navigation bar, a hero section containing text and a profile image, three feature cards, and a footer. It uses Flexbox for navigation, CSS Grid for the hero and feature cards, and media queries for tablet and mobile layouts.
Test the layout conceptually at viewport widths of 320px, 768px, and 1440px. Report at least six possible visual defects. Describe each symptom at a specific viewport width without naming the CSS property responsible or providing code. These reports are hypotheses that must be verified in the browser before being marked as reproduced.

AI QA Tester Report — Responsive Portfolio Layout

Testing scope: Personal portfolio website
Viewport widths: 320px, 768px, and 1440px
Status: Preliminary findings; browser verification required.

Defect 1 — Navigation crowding
Viewport: 320px
The navigation links may appear crowded or wrap onto multiple lines, making the menu harder to scan on a narrow screen.

Defect 2 — Excessive hero heading height
Viewport: 320px
The introductory heading may break into several lines and push the supporting text and call-to-action farther down the page than expected.

Defect 3 — Decorative elements near screen edges
Viewport: 320px
The decorative symbols surrounding the profile image may sit too close to the screen edges or extend beyond the visible content area.

Defect 4 — Header spacing
Viewport: 768px

+ Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

Defect 5 — Hero section balance
Viewport: 768px
The introductory text and profile image may feel compressed when displayed beside each other, reducing readability and visual balance.

Defect 6 — Feature card spacing
Viewport: 1440px
The three feature cards may appear unevenly balanced across the available space, with excessive gaps or inconsistent visual weight.

Verification reminder

These are potential symptoms identified through conceptual review, not confirmed defects. Test each at its specified viewport width and record the actual outcome as **Reproduced**, **Partially reproduced**, or **Not reproduced**.

ChatGPT can make mistakes. Check important info.

+ Ask ChatGPT Think

AI QA Tester — Mobile Layout Verification

Test 1: Navigation and Overall Layout
Viewport: 320px

At this viewport width, does the navigation remain readable and organized? Do the links fit comfortably, wrap onto multiple lines, overlap, or become difficult to tap?

Also, does the hero section—including the heading, description, button, and profile image—fit within the mobile viewport without horizontal scrolling or elements being cut off?

not really it looks clean problem only is u have to scroll down to see the whole page but honestly it looks good in mobile

AI QA Tester — Verification Result

Test 1: Navigation and Overall Layout
Viewport: 320px

+ Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

AI QA Tester — Verification Result

Test 1: Navigation and Overall Layout
Viewport: 320px
Status: Not reproduced

Observation: The navigation and overall mobile layout appear clean and organized. No obvious crowding, overlap, or clipping was reported. The full page requires vertical scrolling, but this is normal behavior for a webpage and does not indicate a responsive layout defect on its own.

Conclusion: The mobile layout appears satisfactory at 320px based on the reported observation. Further testing is needed at 768px and 1440px to evaluate tablet and desktop behavior.

ok

AI QA Tester — Test 2: Tablet Layout

Ask ChatGPT Think

AI QA Tester — Test 2: Tablet Layout

Viewport: 768px

At this width, how does the overall layout appear? In particular, do the navigation links and logo fit comfortably, and does the hero section display the text and profile image clearly?

Do you notice any crowding, overlap, awkward spacing, or other visual problems, or does everything look clean and organized?

the website also already looks good as is, the same problem with 20 you have to scroll to see everything like not everything is in one page but yeah idk if thats a problem i think thats just normal for a website

AI QA Tester — Verification Result

Test 2: Tablet Layout
Viewport: 768px

Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

AI QA Tester — Verification Result

Test 2: Tablet Layout
Viewport: 768px
Status: Not reproduced

Observation: The website appears visually clean and organized at this viewport width. No obvious navigation crowding, overlapping elements, or layout issues were reported.

The page requires vertical scrolling to view all its content. This is normal for most websites and is not, by itself, a responsive design defect. The relevant concern would be whether content becomes inaccessible or causes unwanted horizontal scrolling.

Conclusion: No confirmed responsive layout defect was identified at 768px based on the reported observations. Further testing is required at 1440px.

for 1440, it only looks smaller but again clean website

Ask ChatGPT Think

AI QA Tester — Verification Result

Test 3: Desktop Layout
Viewport: 1440px
Status: Not reproduced

Observation: The website appears clean and organized at this viewport width. The content looks smaller relative to the available screen space, but no obvious overlap, clipping, or alignment problems were reported.

Conclusion: No confirmed responsive layout defect was identified at 1440px based on the reported observation. The website appears visually consistent across the three tested viewport widths: 320px, 768px, and 1440px.

Vertical scrolling is expected for a page containing multiple sections. The smaller appearance on desktop may be a design choice rather than a defect, provided the text remains readable and the content is accessible.

Lucman, Zaheerah Azrah G.
DF21

why does the layout switch to a single-column hero at 650px? what evidence shows that the two-column layout becomes unsuitable at that width rather than at a different width

At 650px, the layout switches to a single-column hero to give the text and profile image more room and maintain readability on narrower screens. However, there is not yet enough testing evidence to prove that 650px is the ideal breakpoint rather than a slightly higher or lower value.

The breakpoint should be justified by testing widths around 650px—for example, 620px, 650px, and 680px—and observing when the text and image begin to feel cramped or the layout loses visual balance. If the two-column layout remains comfortable below 650px, the breakpoint may be unnecessarily high; if it becomes cramped above 650px, it may need to be higher.

why is 900px the correct breakpoint for adjusting the navigation and hero spacing? At what width does the content actually become crowded?

The 900px breakpoint was chosen to give the navigation and hero section more space as the viewport narrows. However, testing at 320px, 768px, and 1440px has not established that 900px is the exact point where the content becomes crowded. Testing around 900px, such as at 880px, 900px, and 920px, would provide better evidence for whether this breakpoint is appropriate.

act as a QA tester. I will describe my layout and paste my CSS. Report defects as symptoms at specific viewport widths. Never name the property at fault and never give code.

my website is a personal portfolio with a navigation bar, a hero section containing text and a profile image, three feature cards, and a footer. It uses Flexbox for navigation, CSS Grid for the hero and feature cards, and media queries for tablet and mobile layouts.

test the layout conceptually at viewport widths of 320px, 768px, and 1440px. Report at least six possible visual defects. Lucman, Zaheerah Azrah G.
DF21

AI QA Tester — Preliminary Responsive Layout Report

The following six items are **potential defects to investigate**, not confirmed bugs. Each must be checked in the browser before receiving a final status.

Report 1 — Navigation Crowding

Viewport: 320px

The navigation links may become crowded, wrap awkwardly, or sit too close together, making it difficult to distinguish individual links.

Report 2 — Hero Text Wrapping

Viewport: 320px

The main heading may wrap across too many lines, making the hero section look unbalanced or pushing the profile image too far down the page.

Report 3 — Profile Image Placement

Viewport: 320px

The profile image may appear disproportionately large or small compared with the text, disrupting the visual

Ask ChatGPT Think

The three feature cards may appear too far apart or too small relative to the available screen width, leaving the section looking visually disconnected.

Verification Instructions

These reports are hypotheses. Open your portfolio in Chrome and inspect the layout at **320px, 768px, and 1440px**.

For each report, record one of these statuses:

- **Reproduced:** You observed the reported symptom.
- **Not reproduced:** The symptom did not occur.
- **Partially reproduced:** Some of the symptom appeared, but not all of it.

Do not change the CSS until you have recorded your observations. If a report is not reproduced, keep that result in your defect log rather than inventing a defect or a fix.

here are my personal observations:

Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

The profile image may appear disproportionately large or small compared with the text, disrupting the visual balance of the hero section.

Report 4 — Navigation Spacing

Viewport: 768px

The navigation links and logo may have uneven spacing, making the header look crowded on a tablet-sized screen.

Report 5 — Hero Section Balance

Viewport: 768px

The hero text and profile image may compete for space, causing the text to look cramped or the image to appear too narrow.

Report 6 — Feature Card Distribution

Viewport: 1440px

The three feature cards may appear too far apart or t small relative to the available screen width, leaving the section looking visually disconnected.

here are my personal observations:
640 the photo isnt on the right sside as it should be its on the bottom so doesnt rly look good but yea theyre all readable and 660px it looks good and clean cuz its on the right side the photo

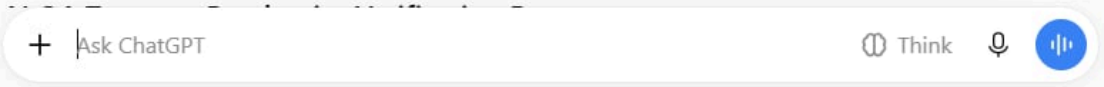

620 not much of a difference

890 also looks good and cleaner just like 660 earlier since the image iss on the right side and not the bottom and again readable still

910 not reaally a noticeable change just had more space but 890 still looks better

for 370 yes readable properly spaced u just need to scroll a bit to see the whole thing but yea i can read it still

for 390 not much of a difference

Lucman, Zaheerah Azrah G.
DF21

AI QA Tester — Breakpoint Verification Report

Thank you. I've recorded your observations. These results are based on your browser testing, not assumptions about how the website should look.

1. Breakpoint Testing Results

380px breakpoint

- **370px:** Navigation and text remain readable and properly spaced. Vertical scrolling is needed to view the entire page.
- **390px:** No significant visual difference from 370px.
- **Finding:** No obvious defect was reported around this breakpoint.
- **Status:** No obvious defect observed.

650px breakpoint

- **620px:** No significant difference from 640px.
- **640px:** The profile image appears below the text. The content remains readable, but the layout looks less appealing to you.
- **660px:** The profile image appears on the right, and the layout looks clean and readable.
- **Finding:** The layout changes around 650px as in led. However, the evidence does not establish that 650px is the optimal breakpoint.

Ask ChatGPT Think

900px breakpoint

- **890px:** The layout looks clean, readable, and visually balanced.
- **910px:** The layout looks similar, with slightly more space. You prefer the appearance at 890px.
- **Finding:** No obvious crowding was reported around 900px. More evidence is needed to justify this breakpoint.
- **Status:** No obvious defect observed.

2. Important Limitation

These tests help justify your breakpoint decisions, but they do **not** independently verify all six preliminary AI QA reports. We still need to check the navigation, hero heading, image proportions, tablet spacing, and feature cards individually at their specified widths.

3. Next Step

Return to **320px** in Chrome and inspect the navigation bar.

Check whether all four links—Home, About, Skills, and Contact—are visible, readable, and properly spaced without overlapping or being cut off.

Report what you actually see. We'll record the result for the defect log before proceeding to the next item.

Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

without overlapping or being cut off.

Report what you actually see. We'll record the result for the defect log before proceeding to the next item.

yes theyre all visible, readable, and properly spaced without overlapping or being cut off.

AI QA Tester — Report 1: Navigation Crowding

Viewport: 320px

Reported symptom: The navigation links might become crowded, wrap awkwardly, or sit too close together.

Your browser test result:

- All four links are visible.
- All links are readable and properly spaced.
- No overlapping or clipping was observed.

Ask ChatGPT Think

Status: NOT REPRODUCED

Conclusion: The navigation remains usable at 320px. The suspected crowding issue was not observed during testing, so no CSS change is needed for this report.

Report 2: Hero Text Wrapping

Viewport: 320px

Reported symptom: The main heading might wrap across too many lines, making the hero section look unbalanced.

Your turn: Keep Chrome at **320px** and look at the main heading in your hero section.

Does the heading look readable and balanced, or does it wrap awkwardly and make the section look cramped?

no awkward wrapping no cramp

Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

AI QA Tester — Report 2: Hero Text Wrapping

Viewport: 320px

Reported symptom: The main heading might wrap across too many lines, making the hero section look unbalanced or cramped.

Your browser test result:

- No awkward text wrapping observed.
- The heading does not make the section look cramped.

Status: NOT REPRODUCED

Conclusion: The hero heading appears readable at 320px. No CSS change is necessary for this report.

Report 3: Profile Image Proportions

Viewport: 320px

Reported symptom: The profile image might appear disproportionately large or small compared with the

Ask ChatGPT Think

Report 3: Profile Image Proportions

Viewport: 320px

Reported symptom: The profile image might appear disproportionately large or small compared with the hero text.

Your turn: Still at **320px**, look at the profile image.

Does its size look balanced with the text, or does it look too large or too small?

not really although the contact is a bit too on the right on this one but its c lean

AI QA Tester — Report 3: Profile Image Proportions

Viewport: 320px

Reported symptom: The profile image might appear disproportionately large or small compared with the hero text

Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

Your browser test result:

- The profile image does not appear noticeably too large or too small.
- The overall layout looks clean.
- You noticed that the contact item is positioned a little too far to the right.

Status: PARTIALLY REPRODUCED

Conclusion: The suspected image-size problem was not observed. However, your observation about the Contact item suggests a possible minor alignment issue that should be checked separately before deciding whether a CSS adjustment is necessary.

Report 4: Navigation Spacing

Viewport: 768px

Reported symptom: The navigation links and logo might have uneven spacing, making the header look crowded on a tablet-sized screen.

Your turn: Set Chrome's responsive width to **768px**. L[illegible]k at the logo and all four navigation links.

+ Ask ChatGPT Think

Viewport: 1440px

Reported symptom: The three feature cards might appear too small or too far apart on a wide screen.

Your browser test result:

- The text appears too small.
- The cards seem somewhat far apart.

Status: REPRODUCED

Conclusion: Your observation supports the suspected visual issue at 1440px. The feature card section could benefit from improved text readability and spacing. Before changing the CSS, identify which specific text is too small and whether the cards themselves feel too widely spaced.

QA Testing Summary

We have now reviewed all six preliminary reports.

Report	Viewport	Result

+ Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

QA Testing Summary

We have now reviewed all six preliminary reports.

Report	Viewport	Result
Navigation crowding	320px	Not reproduced
Hero text wrapping	320px	Not reproduced
Profile image proportions	320px	Partially reproduced — minor Contact alignment concern
Navigation spacing	768px	Not reproduced
Hero section balance	768px	Not reproduced
Feature card distribution	1440px	Reproduced

Important: The image-size concern in Report 3 was not observed; only the Contact alignment concern was noticed. Keep those observations distinct in your defect log.

Ask ChatGPT Think

AI QA Tester — Follow-up to Report 6

Viewport: 1440px
Result: Both text size and card spacing are concerns.

Confirmed observations:

- Text inside the feature cards appears too small.
- The cards appear too far apart.
- The issue affects the visual balance of the section on a wide screen.

Status: REPRODUCED

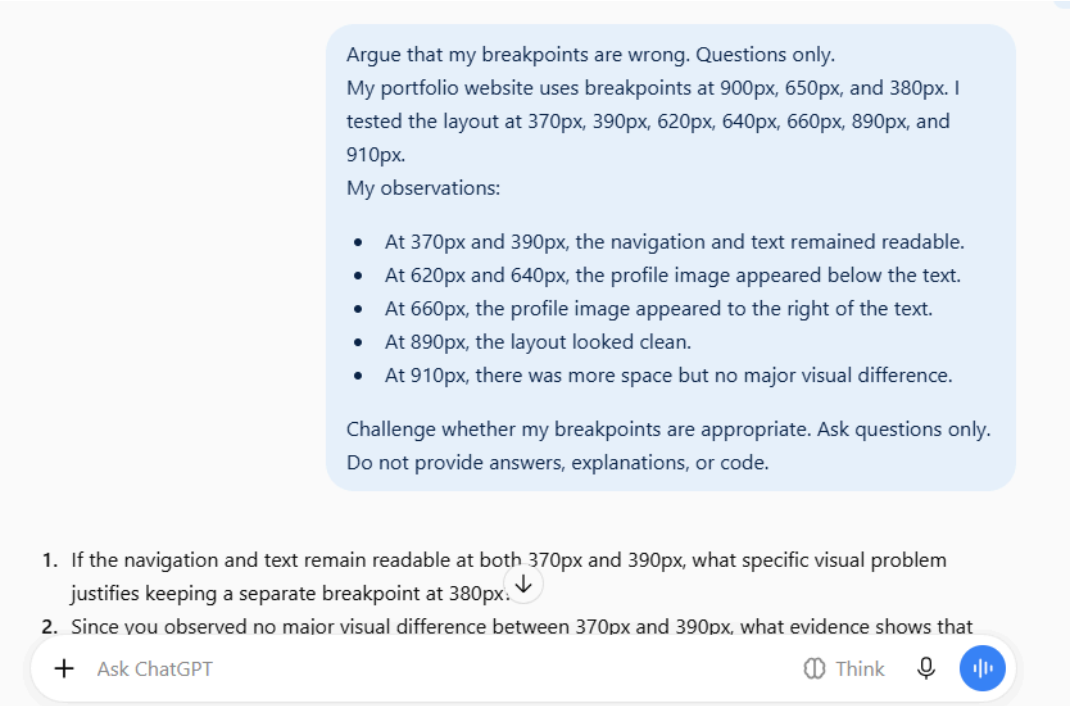

Proposed next action: Review the feature card section to determine whether the text needs to be more readable and the cards need to be grouped more closely. Any change should be tested again at 1440px and checked at 768px and 320px to ensure it doesn't harm the existing layouts.

End of preliminary QA report. No CSS has been changed yet.

Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

Breakpoint Challenge and Evaluation

1. If the navigation and text remain readable at both 370px and 390px, what specific visual problem justifies keeping a separate breakpoint at 380px?
2. Since you observed no major visual difference between 370px and 390px, what evidence shows that 380px is the most appropriate width for changing the layout?
3. If the hero layout looks clean at 660px but stacks at 640px, did you test widths between 640px and 660px to determine the exact point where the side-by-side layout becomes cramped?
4. Since the profile image appears below the text at 620px and 640px, how do you know the 650px breakpoint is based on the content's needs rather than an arbitrary choice?
5. If the layout looks clean at 890px and has more space at 910px without a major visual difference, what specific problem does the 900px breakpoint solve?
6. Did you test widths immediately below and above 900px to verify whether the layout changes meaningfully at that breakpoint?
7. If the website remains readable across all the tested widths, what additional evidence would demonstrate that your three breakpoints are necessary rather than fewer breakpoints?
8. How would you determine whether your breakpoints should be adjusted based on content behavior instead of choosing widths based on common device sizes?

Ask ChatGPT Think

Lucman, Zaheerah Azrah G.
DF21

1. The 380px breakpoint was included to adjust the layout for smaller mobile screens. During testing at 370px and 390px, the navigation and text remained readable, so I did not observe a major problem at these widths. More testing would be needed to confirm whether the 380px breakpoint is necessary.
2. My tests at 370px and 390px showed that the layout remained readable at both widths. However, these results do not prove that 380px is the best breakpoint. Testing additional widths around 380px would help determine whether a layout change is needed.
3. I tested the layout at 640px and 660px. At 640px, the profile image appeared below the text, while at 660px, it appeared to the right of the text. I did not test every width between them, so I cannot identify the exact width where the layout should change.
4. I chose the 650px breakpoint to allow the hero content to stack on narrower screens and appear side by side on wider screens. My observations at 640px and 660px showed that both layouts were readable, alth[illegible]h I preferred the side-by-side appearance.
5. The 900px breakpoint adjusts the layout for narrower screens. [illegible]

Ask ChatGPT Think

5. The 900px breakpoint adjusts the layout for narrower screens. However, my tests at 890px and 910px showed no major visual difference. More testing is needed to determine whether this breakpoint is necessary or should be adjusted.
6. I tested the layout at 890px and 910px. Both looked clean, and the main difference was that 910px provided more space. I did not observe a major layout problem around 900px, so additional testing would help justify this breakpoint.
7. My tests showed that the website remained readable at the widths I checked. To determine whether all three breakpoints are necessary, I would test additional widths around each breakpoint and look for actual problems with spacing, alignment, readability, or content arrangement.
8. I would determine breakpoints by testing where the content starts to look cramped, misaligned, or difficult to read. I would compare widths immediately below and above each breakpoint and choose values that im[illegible]ove the layout based on these observations.
